

DeltaGard[®] SC

DeltaGard SC Labeled for Control of Ticks

Blacklegged ticks (BLT) can carry bacteria that cause Lyme disease, and are a major public health concern. Lyme disease is on the rise in Canada, as these ticks continue to spread into new areas.

Professional Pest Management Companies looking for a solution to help manage ticks can look no further than DeltaGard SC. Containing the active ingredient deltamethrin, DeltaGard SC is now registered for control of ticks in Canada.

A trusted broad spectrum pyrethroid insecticide registered for control of ants, chinch bugs, cutworm and sod webworm on turfgrass, DeltaGard SC is now also labeled to control ticks.

How to Use DeltaGard SC

Use DeltaGard SC in conjunction with a comprehensive management program that includes modifying the landscape habitat around the home to help minimize harbourage areas for ticks.

Treat with DeltaGard SC in a 3m band to turf areas around property lines or around structures such as dog houses, kennels, sidewalks, pathways or patios to help protect against ticks around the home.

Turf areas that are of particular importance to observe for ticks include those adjacent to forested areas, stonewalls, ornamental plantings and other areas where there is overgrown vegetation.

Reduce tick habitat through landscape management practices including but not limited to mowing the turf and removal of weeds, leaf litter and other debris where ticks are found.

Application Rate: 12 ml/100m²

Water Volume: 8L/100m²
